

Emphasized implicit essentials in CMF

Wing neutralization

FD change of system ($EDS \rightleftharpoons GDS$) on vectors (mixed order) $\Rightarrow$ motor polar-end-domain may compose eternal song: ON (-ive/ $-^Q \rightarrow +ive/+^Q$) $\rightarrow$ pitch/frequency signatory extremal (fast) and FN (+ive/ $+^C \rightarrow -ive/-^C$) $\rightarrow$ timber signatory extremal (slow) $\rightarrow$ pseudovector $\rightarrow$ before Baton pass. Alternate pair of energy wings and gravity wings neutralize both systems wing-wise because previous pair is combination of motor (future¹) EDS (Macrocosm/future¹ future²/FN) and sensory (past¹) GDS (microcosm/past¹ past²/ON) and later pair is combination of motor¹ GDS (Macrocosm/future¹ past²/ON) and sensory¹ EDS (microcosm/past¹ future²/FN).

No wing change (gravity $\nleftrightarrow$ energy) $\rightarrow$ pseudovector (EDS/GDS end $\rightarrow$ GDS/EDS begin) $\rightarrow$ Baton interchange $\rightarrow$ equatorial $\rightarrow$ 2nd order scalar / pseudoscalar $\rightarrow$ Nontrivial/trivial Nulls at center of Bioevolute $\rightarrow$ cognitive indefinite stationaries: Mapping (on Cl-q or q-Cl exclusive cognitive differences on cP-symmetry), Cl-q measurements on Baton solution at ED pulsating zone $\times$ (on collective inclusive cognitive indifferences on CPT-symmetry).

Journey: Evolutionary / Volition

micro sensory journey created by integrator-induced ($-1/-v-1$) evolutionary untwist-pull towards gravity null in EDS and levity null in GDS against complementary vectors' run ($\mathbf{m/p}$) beyond integration ($0^Q/0^C$) towards unknown past-future/past-past microcosm (micro-Null)

instigated before differentials of next sensory begin on one step advancement. Motor wing integrate twisting forms inherently. Sensory differentiator operations untwist the information differentially towards BNs on gravity null along quaternion geometry in both the systems towards bihelical memory storage under the constrain of Lyapunov exponent (-1 in Hamiltonian total energy function e^{-x}) along equator/energy axis out of inputs from poles/gravity axis. In sensory end, dynamism gets completely exhausted remain functionally rudimentary where spin continue on integrators (pseudovectors) within heavily curved integrals ($p/m \rightarrow 0^Q/0^C$) tend to get relieved by differential twist freely towards Motor end Levity ($+^C$) $\gg$ Gravity ($-^Q$) boosted initially by complementary integrated vectors ($m/p \rightarrow 0^C/0^Q$) at motor beginning (wing toggle/not the system) : mapping (Cl-q/q-CL) in same cycle under cP-symmetry. At motor end, dynamism get fatigued at differentiators: $0^Q \rightarrow$ superposition and $0^C \rightarrow$ superconductivity. Under sensory-wing-reversion-pull journey leap over ED-phase, get advanced for baton reversal shift ($0^C \rightarrow +^Q$ and $0^Q \rightarrow -^C$) that extend to complimentary sensory wing (system toggle but not the wing). Complementary dynamism polarly restarts ($0^C/0^Q$) before finite sensory begin ($+^Q$, gravity $-^C$, energy) or alternately may back to original form via mode-lock-halt integrally in nontrivial '0' at baton center induce 'Null Field' under grey influence in proper time in central ED-phase equilibrating Macrocosm with microcosm under CPT-symmetry. Universal common nullification in proper time may get revealed individually in next cycle under cP-symmetry or further may undergo Samadhi (deep awareness +) for indefinite period on trivial '0'. Here selectively inter P/AP ascendance = 2 where topological distortion of π in evolutionary ED-steps in self-organization are compromisingly minimum.

In volition individual twist begins along sensory wings where initiating null inverses (ON/FN) in reference to evolutionary untwist (proximodistal $\rightarrow$ distoproxymal). As volitional journey is individual against complimentary vector ($\mathbf{m/p}$) here chance of creating disharmony including chaos is frequent as rest others advance evolutionarily. One may exceptionally learn to coordinate the skill of volitional journey with the background of evolutionary journey by synchronizing grey points within, may create awful performance often specially in games, sports and athletics etc.

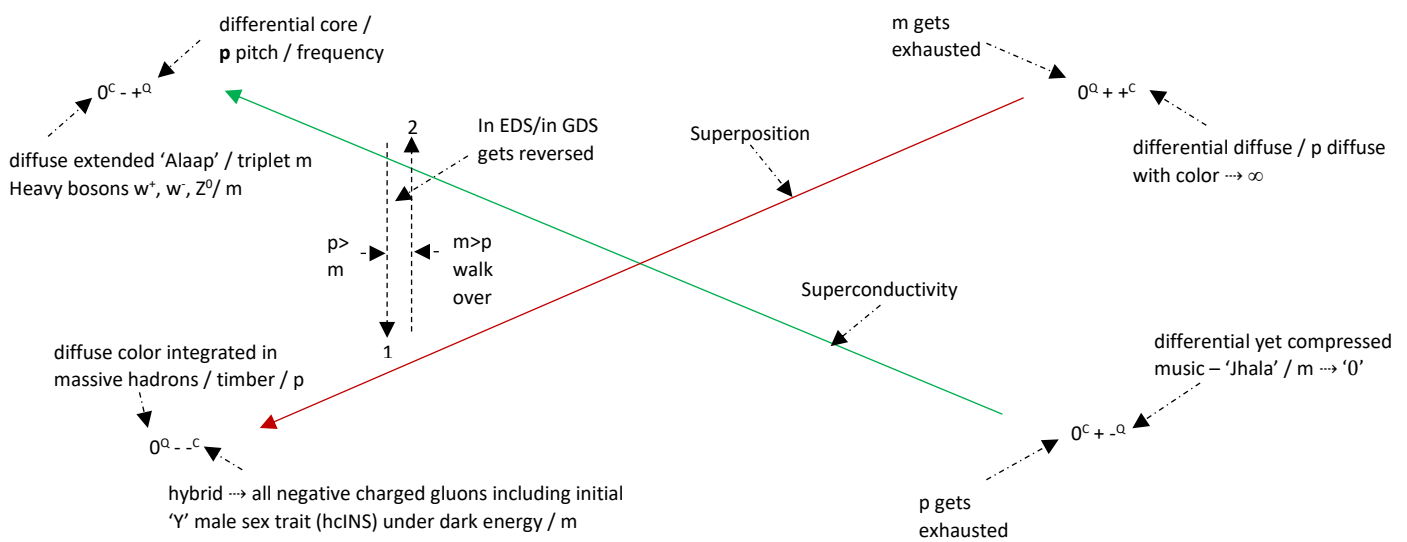

In rotational context EDS sensory end under polar contest q (0^Q) finalize in motor Cl ($+^C 0^Q -^C$) induce next step evolutionary advancement whereas in GDS sensory end Cl (0^C) finalize in motor q ($-^Q 0^C +^Q$) induce next step complementary GDS $\rightleftharpoons$ EDS sensory begin. But under equatorial context in spin context $p(\uparrow)m(\uparrow)$ total energy follow same direction, get observable equatorially (BNs to BNm) under quaternion geometry as Re Hamiltonian difference, sensory unimodal finite constrains of REM pattern. But polar p (ON to FN) against m (FN to ON) in EDS (reverse in GDS) carry complex Hermitian indifference, bimodal nullification without constrains inciting NREM pattern.

Light in quantum algorithm

In rotational context EDS sensory ends in q (0^Q) and motor end Cl ($+0^Q - C$) before next evolutionary advancement whereas GDS sensory ends in Cl (0^C) and motor end q ($-0^C + Q$) advances to next complimentary evolutionary advancement. In spin context p ($\uparrow$) and m ($\uparrow$) pursue same along Bioevolute where total energy as wavefunction get functionally reduced be observable as Re Hamiltonian difference (BNs to BNm) at equator c.f., polar p (ON to FN) against m (FN to ON) in EDS (reverse in GDS) carry complex Hermitian indifference initially.

Speed of light c conserve Finite Rotational Constant (FRC) in BNm. In case $V2$ bar slant flattens; hence length contracts as space run fast in reference frame and q negentropy/amplitude/timber condenses; hence time gets slow in reference frame conserve constant space-time in measuring speed of light in all exclusive individual reference frames collectively unify axes same unitary x/y orthonormal axis assign same tune on different timber collectively. But if all reference frames activate simultaneously in common inclusive frame collectively journey appears nullified in indifferent proper time where measurement registration only feasible in next cycle on spontaneous symmetry break.

FN replenish back sucked Cl-entropy as eternal harmonic composition

FN replenish back sucked Cl-entropy $\rightarrow$ baton solution + exclusive genomic decoding $\rightarrow$ memory in next cycle
